12 May 2011

## Our historical goals

- Find large grain data and task parallelism includes medium and fine grain parallelism

Still holding today for manycore and GPU computing!

## Our historical goals

- Find large grain data and task parallelism includes medium and fine grain parallelism
- Interprocedural analyses: whole program compilation
- full inlining is ineffective because of complexity
- cannot cope with recursion

Still holding today for manycore and GPU computing!

## Our historical goals

- Find large grain data and task parallelism includes medium and fine grain parallelism
- Interprocedural analyses: whole program compilation
- full inlining is ineffective because of complexity
- cannot cope with recursion
- Interprocedural transformations selective inlining and outlining and cloning are useful

Still holding today for manycore and GPU computing!

## Our historical goals

- Find large grain data and task parallelism includes medium and fine grain parallelism
- Interprocedural analyses: whole program compilation
- full inlining is ineffective because of complexity
- cannot cope with recursion
- Interprocedural transformations selective inlining and outlining and cloning are useful
- No restrictions on input code... Fortran 77, 90, C, C99

Still holding today for manycore and GPU computing!

Control simplification, constant propagation, partial evaluation, induction variable substitution, scalarization, inlining, outlining, invariant generation, property proof, memory footprint, dead code elimination...

- Code synthesis

## Simplified notations

- Identifiers $i, a$, Locations / or $(a, \phi)$, Values
- Environment: $\rho: I d \rightarrow$ Loc
- Memory state: $\sigma:$ Loc $\rightarrow$ Val, $\sigma(i)=0$
- Preconditions: $P(\sigma) \subset \Sigma$, for $(\mathrm{i}=0$; i<n; i++) $\{\ldots\} \longrightarrow\{\sigma \mid 0 \leq \sigma(i)<\sigma(n)\}$
- Transformers: $T\left(\sigma, \sigma^{\prime}\right) \subset \Sigma \times \Sigma$, i++; $\longrightarrow\left\{\left(\sigma, \sigma^{\prime}\right) \mid \sigma^{\prime}(i)=\sigma(i)+1\right\}$
- Array regions: $R: \Sigma \rightarrow$ Loc, $\mathrm{a}[\mathrm{i}] \longrightarrow \sigma \rightarrow\{(a, \phi) \mid \phi=\sigma(i)\}$
- Statements $S, S_{1}, S_{2} \in \Sigma \rightarrow \Sigma$ function call, sequence, test, loop, CFG...
- Programs П: a statement

## Convex Array Region for a Reference

$$
\begin{aligned}
& W_{S_{1}}(\sigma)=\{(a, \phi) \mid 0 \leq \phi<5\} \\
& \text { for }(\mathrm{i}=0 ; \mathrm{i}<5 ; \mathrm{i}++) \\
& \quad W_{S_{2}}(\sigma)=\{(a, \phi) \mid \phi=\sigma(i)[\wedge 0 \leq \sigma(i)<5]\} \\
& \mathrm{a}[\mathrm{i}]=0 .
\end{aligned}
$$

## Convex Array Regions of Statement S

Property of a written region $W_{S}$

$$
\begin{equation*}
\forall \sigma \quad \forall I \notin W_{S}(\sigma), \quad \sigma(I)=(S(\sigma))(I) \tag{1}
\end{equation*}
$$

Note: The property holds for any over-approximation $\overline{W_{S}}$ of $W_{S}$.

## Property of a read region $R_{S}$

$$
\begin{array}{r}
\forall \sigma \quad \forall \sigma^{\prime}  \tag{2}\\
\forall I \in R_{S}(\sigma), \sigma(I)=\sigma^{\prime}(I) \Rightarrow\left\{\begin{array}{l}
R_{S}(\sigma)=R_{S}\left(\sigma^{\prime}\right) \\
W_{S}(\sigma)=W_{S}\left(\sigma^{\prime}\right) \\
\forall I \in W_{S}(\sigma),(S(\sigma))(I)=\left(S\left(\sigma^{\prime}\right)\right)(I)
\end{array}\right.
\end{array}
$$

Note: The property holds for any over-approximation $\overline{R_{S}}$ of $R_{S}$ in the left-hand side, but not for other over-approximations.

## Conditions to exchange two statements $S_{1}$ and $S_{2}$

Evaluation of $S_{1} ; S_{2}: \sigma \xrightarrow{S_{1}} \sigma_{1} \xrightarrow{S_{2}} \sigma_{12}$
Assumptions:

$$
\begin{array}{ll}
\forall \sigma, & W_{S_{1}}(\sigma) \cap R_{S_{2}}\left(\sigma_{1}\right)=\varnothing \\
\forall \sigma, & W_{S_{1}}(\sigma) \cap W_{S_{2}}\left(\sigma_{1}\right)=\varnothing \tag{4}
\end{array}
$$

Final state $\sigma_{12}$ :

$$
\begin{aligned}
& \text { (3) } \begin{aligned}
& \forall I \in R_{S_{2}}\left(\sigma_{1}\right), \quad I \notin W_{S_{1}}(\sigma) \stackrel{(1)}{\Longrightarrow} \sigma_{1}(I)=\sigma(I) \\
& \stackrel{(2)}{\Longrightarrow}\left\{\begin{array}{l}
R_{S_{2}}\left(\sigma_{1}\right)=R_{S_{2}}(\sigma) \\
W_{S_{2}}\left(\sigma_{1}\right)=W_{S_{2}}(\sigma) \\
\forall I \in W_{S_{2}}(\sigma), \quad \sigma_{12}(I)=\sigma_{2}(I)
\end{array}\right. \\
&(4) \forall I \in W_{S_{1}}, \quad I \notin W_{S_{2}} \Longrightarrow \sigma_{12}(I)=\sigma_{1}(I) \\
& \forall I \notin W_{S_{1}} \cup W_{S_{2}}, \quad \sigma(I)=\sigma_{1}(I)=\sigma_{12}(I)
\end{aligned}
\end{aligned}
$$

## Conditions to exchange two statements $S_{1}$ and $S_{2}$

Evaluation of $S_{2} ; S_{1}: \sigma \xrightarrow{S_{2}} \sigma_{2} \xrightarrow{S_{1}} \sigma_{21}$
Assumptions:

$$
\begin{array}{ll}
\forall \sigma, & W_{S_{2}}(\sigma) \cap R_{S_{1}}\left(\sigma_{2}\right)=\varnothing \\
\forall \sigma, & W_{S_{2}}(\sigma) \cap W_{S_{1}}\left(\sigma_{2}\right)=\varnothing \tag{6}
\end{array}
$$

Final state $\sigma_{21}$ :

$$
\begin{aligned}
& (5) \forall I \in R_{S_{1}}\left(\sigma_{2}\right), \quad I \notin W_{S_{2}}(\sigma) \stackrel{(1)}{\Longrightarrow} \sigma_{2}(I)=\sigma(I) \\
& \quad \stackrel{(2)}{\Longrightarrow}\left\{\begin{array}{l}
R_{S_{1}}\left(\sigma_{2}\right)=R_{S_{1}}(\sigma) \\
W_{S_{1}}\left(\sigma_{2}\right)=W_{S_{1}}(\sigma) \\
\forall I \in W_{S_{1}}\left(\sigma_{2}\right), \quad \sigma_{21}(I)=\sigma_{1}(I)
\end{array}\right. \\
& (6) \forall I \in W_{S_{2}}(\sigma), \quad I \notin W_{S_{1}}\left(\sigma_{2}\right) \Rightarrow \sigma_{21}(I)=\sigma_{2}(I) \\
& \forall I \notin W_{S_{1}}\left(\sigma_{2}\right), \cup W_{S_{2}}(\sigma) \quad \sigma(I)=\sigma_{2}(I)=\sigma_{21}(I)
\end{aligned}
$$

## Bernstein's Conditions to Exchange $S_{1}$ and $S_{2}$

- Necessary condition:

$$
\forall \sigma \quad \text { let } \sigma_{1}=S_{1}(\sigma), \sigma_{2}=S_{2}(\sigma)
$$

$$
\left.\begin{array}{l}
W_{S_{1}}(\sigma) \cap R_{S_{2}}\left(\sigma_{1}\right)=\varnothing \\
W_{S_{1}}(\sigma) \cap W_{S_{2}}\left(\sigma_{1}\right)=\varnothing \\
W_{S_{2}}(\sigma) \cap R_{S_{1}}\left(\sigma_{2}\right)=\varnothing \\
W_{S_{2}}(\sigma) \cap W_{S_{1}}\left(\sigma_{2}\right)=\varnothing
\end{array}\right\} \Longrightarrow\left\{\begin{array}{l}
W_{S_{1}}(\sigma) \cap R_{S_{2}}(\sigma)=\varnothing \\
W_{S_{1}}(\sigma) \cap W_{S_{2}}(\sigma)=\varnothing \\
W_{S_{2}}(\sigma) \cap R_{S_{1}}(\sigma)=\varnothing
\end{array}\right.
$$

according to the two previous slides.

## Starting from Bernstein's conditions

- Let's assume: $\forall \sigma W_{S_{1}}(\sigma) \cap R_{S_{2}}(\sigma)=\varnothing$
- This implies by (1): $\forall \sigma \forall I \in R_{S_{2}} \quad\left(S_{1}(\sigma)\right)(I)=\sigma(I)$
- Hence by (2): $\forall \sigma R_{S_{2}}\left(\sigma_{1}\right)=R_{S_{2}}(\sigma) \wedge W_{S_{2}}\left(\sigma_{1}\right)=W_{S_{2}}(\sigma)$
- In the same way: $\forall \sigma W_{S_{2}}(\sigma) \cap R_{S_{1}}(\sigma)=\varnothing$
- Implies: $R_{S_{1}}\left(\sigma_{2}\right)=R_{S_{1}}(\sigma) \wedge W_{S_{1}}\left(\sigma_{2}\right)=W_{S_{1}}(\sigma)$

So Bernstein's conditions are sufficient to prove:

$$
\forall \sigma \quad\left(S_{1} ; S_{2}\right)(\sigma)=\left(S_{2} ; S_{1}\right)(\sigma)
$$

## Coarse grain parallelization of a loop

- Let's assume convex array regions $R_{B}$ and $W_{B}$ for the loop body
- Let $P_{B}$ be the body precondition and $T_{B, B}^{+}$the inter-iteration transformer
- Direct parallelization of a loop using convex array regions with Bernstein's conditions for the iterations of the body $B$ :
$\forall v \in I d \quad \forall \sigma, \sigma^{\prime} \in P_{B}$ s.t. $T_{B, B}^{+}\left(\sigma, \sigma^{\prime}\right)$
$R_{B, v}(\sigma) \cap W_{B, v}\left(\sigma^{\prime}\right)=\varnothing$
$R_{B, v}\left(\sigma^{\prime}\right) \cap W_{B, v}(\sigma)=\varnothing$
$W_{B, v}(\sigma) \cap W_{B, v}\left(\sigma^{\prime}\right)=\varnothing$
- Note: $T_{B, B}^{+}\left(\sigma, \sigma^{\prime}\right) \Rightarrow \sigma(i)<\sigma^{\prime}(i)$ where $i$ is the loop index
- Each iteration can be interchanged with any other one.
- No dependence graph, no restrictions on loop body, no restriction on control, no restriction on references, no restriction on loop bounds...

## Coarse Grain Parallelization of a Loop with Privatization

- Beyond Bernstein's conditions, use $I N_{B}$ and $O U T_{B}$ array regions instead of $R_{B}$ and $W_{B}$ regions
- Insure non-interference for interleaved execution: privatization or expansion for locations in $W_{B}-O U T_{b}$
- $O U T_{B}$ can be over-approximated with $\overline{O U T_{B}}$ because it is used to decide the parallelization
- $W_{B}$ cannot be overapproximated
- Must be combined with reduction detection

## Fusion of Loops $L_{1}$ and $L_{2}$ with delay $d$

- for(i1...) S1; for(i2...) S2
- initial schedule:

$$
\begin{aligned}
& S_{1}^{0} \rightarrow S_{1}^{1} \rightarrow S_{1}^{2} \rightarrow S_{1}^{3} \rightarrow S_{1}^{4} \\
& S_{2}^{0} \rightarrow S_{2}^{1} \rightarrow S_{2}^{2} \rightarrow S_{2}^{3} \rightarrow S_{2}^{4} \rightarrow
\end{aligned}
$$

- new schedule:

$$
S_{1}^{0} \rightarrow S_{1}^{1} \rightarrow S_{2}^{0} \rightarrow S_{1}^{2} \rightarrow S_{2}^{1} \rightarrow S_{1}^{3} \rightarrow S_{2}^{2} \rightarrow S_{1}^{2}
$$

- for(...) S1; for(...) \{S1;S2\} for(...) S2

## Fusion of Loops $L_{1}$ and $L_{2}$ with delay $d$ : Legality

- Assumes convex array regions $R_{1}$ and $W_{1}$ for body $B_{1}$ of loop $L_{1}$ with index $i_{1}, R_{2}$ and $W_{2}$ for body $B_{2}$ of loop $L_{2}$ with index $i_{2}$
- Permutation of the last iterations of $L_{1}$ and the first iterations of $L_{2}$ with a delay $d$ :

$$
\begin{aligned}
\forall \sigma_{1} \forall \sigma_{2} \quad P_{1}\left(\sigma_{1}\right) \wedge & P_{2}\left(\sigma_{2}\right) \wedge T_{12}\left(\sigma_{1}, \sigma_{2}\right) \wedge \sigma_{1}\left(i_{1}\right)>\sigma_{2}\left(i_{2}\right)+d \\
& R_{1}\left(\sigma_{1}\right) \cap W_{2}\left(\sigma_{2}\right)=\varnothing \\
& R_{2}\left(\sigma_{2}\right) \cap W_{1}\left(\sigma_{1}\right)=\varnothing \\
& W_{1}\left(\sigma_{1}\right) \cap W_{2}\left(\sigma_{2}\right)=\varnothing
\end{aligned}
$$

- $P_{1}, P_{2}, T_{12}, R_{1}, W_{1}, R_{2}, W_{2}$ can be all over-approximated
- Check emptiness of convex sets for a polyhedral instantiation
- No restrictions on $B_{1}$ nor $B_{2}$ nor the loop index identifiers or ranges

## Fusion of Loops $L_{1}$ and $L_{2}$ with delay d: Profitability

- Reduce memory loads:

$$
\left(\bigcup_{\sigma_{1} \in P_{1}} R_{1}\left(\sigma_{1}\right)\right) \bigcap \bigcup_{\sigma_{2} \in P_{2} \cap T_{1,2}\left(\sigma_{1}\right)} R_{2}\left(\sigma_{2}\right) \neq \varnothing
$$

- Avoid intermediate store and reloads:

$$
\left(\bigcup_{\sigma_{1} \in P_{1}} W_{1}\left(\sigma_{1}\right)\right) \bigcap \bigcup_{\sigma_{2} \in P_{2} \cap T_{1,2}\left(\sigma_{1}\right)} R_{2}\left(\sigma_{2}\right) \neq \varnothing
$$

- With minimal cache size:

$$
\left(\bigcup_{\sigma_{1} \in P_{1}}\left(R_{1}\left(\sigma_{1}\right) \cup W_{1}\left(\sigma_{1}\right)\right)\right) \bigcup \bigcup_{\sigma_{2} \in P_{2} \cap T_{1,2}\left(\sigma_{1}\right)}\left(R_{2}\left(\sigma_{2}\right) \cup W_{2}\left(\sigma_{2}\right)\right)
$$

## Array privatization

- An array a is privatizable in a loop / with body $B$ if

$$
\forall \sigma \in P_{B}, \quad I N_{B, a}(\sigma)=O U T_{B, a}(\sigma)=\varnothing
$$

- $I N_{B, a}$ is the set of elements of a whose input values are used in $B$. For a sequence $\mathrm{S} 1 ; \mathrm{S} 2$ :

$$
I N_{S_{1} ; S_{2}}=I N_{S_{1}} \cup\left(\left(I N_{S_{2}} \circ T_{S_{1}}\right)-W_{S_{1}}\right)
$$

- $O U T_{B, a}(\sigma)$ is the set of elements of $a$ whose output values are used by the continuation of $B$ executed in memory state $\sigma$. For a sequence $\mathrm{S} 1 ; \mathrm{S} 2$ :

$$
O U T_{S_{1}}=\left(O U T_{S_{1} ; S_{2}}-W_{S_{2}} \circ T_{S_{1}}\right) \cup\left(W_{S_{1}} \cap I N_{S_{2}} \circ T_{S_{1}}\right)
$$

## Examples of IN and OUT regions

- Source code for function foo

```
void foo(int n, int i, int a[n], int b[n]) {
    a[i] = a[i]+1;
    i++;
    b[i] = a[i]; }
```

- Source code for main:

```
int main() {
    int a[100], b[100], i;
    foo(100, i, a, b);
    printf("%d\n", b[0]); }
```

- R,W,IN and OUT array regions for call site to foo:

```
// <a[PHI1]-R-EXACT-{i<=PHI1, PHI1<=i+1}>
// <a[PHI1]-W-EXACT-{PHI1==i}>
// <b[PHI1]-W-EXACT-{PHI1==i+1}>
// <a[PHI1]-IN-EXACT-{i<=PHI1, PHI1<=i+1}>
// <b[PHI1]-OUT-EXACT-{PHI1==0, PHI1==i+1}>
    foo(100, i, a, b);
```

## Properties of IN regions

- If two states $\sigma$ and $\sigma^{\prime}$ assign the same values to the locations in $I N_{S}$, statement $S$ produces the same trace with $\sigma$ and $\sigma^{\prime}$ :

$$
\begin{aligned}
\forall \sigma & \forall \sigma^{\prime} \\
\forall I \in I N_{S}(\sigma), \sigma(I)=\sigma^{\prime}(I) \Rightarrow & \left\{\begin{array}{l}
R_{S}(\sigma)=R_{S}\left(\sigma^{\prime}\right) \\
W_{S}(\sigma)=W_{S}\left(\sigma^{\prime}\right) \\
I N_{S}(\sigma)=I N_{S}\left(\sigma^{\prime}\right) \\
\forall I \in W_{S}(\sigma),(S(\sigma))(I)=\left(S\left(\sigma^{\prime}\right)\right)(I)
\end{array}\right.
\end{aligned}
$$

- Almost identical to property for $R$ regions
- But also $\forall \sigma \quad \forall \sigma^{\prime}$ :

$$
\forall I \notin \bigcup_{\sigma \in P_{S}}\left(R_{S}(\sigma)-I N_{S}(\sigma)\right), \sigma(I)=\sigma^{\prime}(I) \Rightarrow \text { Equivalent }_{s}\left(\sigma, \sigma^{\prime}\right)
$$

## Properties of OUT regions

- The values of variables written by $S$ but not used later do not matter:

$$
\begin{align*}
& \forall \sigma, \forall \sigma^{\prime}, \forall I \notin \bigcup_{\sigma \in P_{S}}\left(W_{S}(\sigma)-\text { OUT }_{S}(\sigma)\right),  \tag{8}\\
& (S(\sigma))(I)=\left(S\left(\sigma^{\prime}\right)\right)(I) \Rightarrow \text { Equivalent }_{C}\left(\sigma, \sigma^{\prime}\right)
\end{align*}
$$

- In other words, statement $S$ can be substituted by statement $S^{\prime}$ in Program $\Pi$ if they only differ by writing different values in memory locations that are not read by the continuation

## Scalarization

- Replace a set of array references by references to a local scalar:

$$
\begin{aligned}
& \mathrm{a}[j]=0 ; \operatorname{for}(i \ldots) \quad\{\ldots \quad a[j]=a[j] * b[i] ; \ldots\} \\
& \rightarrow s=0 ; \text { for }(i \ldots) \quad\{\ldots \quad s *=b[i] ; \ldots \quad\} \quad a[j]=s ;
\end{aligned}
$$

- Let $B$ and $i$ be a loop body and index, and $W_{B}$ the write region function
- Sufficient condition: each loop iteration accesses only one array element
- Let
$f:$ Val $\rightarrow \mathcal{P}(\Phi)$ s.t. $f(v)=\left\{\phi \mid \exists \sigma: \sigma(i)=v \wedge(a, \phi) \in W_{B}(\sigma)\right\}$
- If $f$ is a mapping $\mathrm{Val} \rightarrow \Phi$, array a can be replaced by a scalar.
- Initialization and exportation according to $I N_{B}$ and $O U T_{B}$.

## Statement Isolation

- Goal: replace $S$ by a new statement $S^{\prime}$ executable with a different memory $M^{\prime}$ :
$i=i+1$;
$\rightarrow$ int $j ; j=i ; j=j+1 ; i=j ;\}$
- Let $S$ be a statement with regions $R_{S}, W_{S}, I N_{S}$ and $O U T_{s}$.
- Declare new variables new $(I)$ for $I \in \cup_{\sigma \in P_{S}}\left(R_{S}(\sigma) \cup W_{S}(\sigma)\right)$
- Copy in: $\forall I \in I N_{S}(\sigma) M^{\prime}[n e w(I)]=M[/]$
- Substitute all references to $I$ by references to new $(I)$ in $S$
- Copy out: $\forall I \in O U T_{S}(\sigma) M[I]=M^{\prime}[\operatorname{new}(I)]$

## Statement Isolation

- Goal: replace $S$ by a new statement $S^{\prime}$ executable with a different memory $M^{\prime}$ :
$i=i+1$;
$\rightarrow$ int $j$; $j=i ; j=j+1 ; i=j ;\}$
- Let $S$ be a statement with regions $R_{S}, W_{S}, I N_{S}$ and $O U T_{s}$.
- Declare new variables new $(I)$ for $I \in \cup_{\sigma \in P_{S}}\left(R_{S}(\sigma) \cup W_{S}(\sigma)\right)$
- Copy in: $\forall I \in I N_{S}(\sigma) M^{\prime}[n e w(I)]=M[I]$
- Substitute all references to $I$ by references to new $(I)$ in $S$
- Copy out: $\forall I \in O U T_{S}(\sigma) M[I]=M^{\prime}[n e w(I)]$
- Copy out fails because of over-approximations of $O U T_{S}$ !
- Copy in: $\forall I \in \overline{\left(I N_{S}(\sigma)\right)} \cup \overline{\left(O U T_{S}(\sigma)\right)} M^{\prime}[n e w(I)]=M[I]$
- related to outlining and privatization and localization

## Induction variable substitution

- Substitute $k$ by its value, function of the loop index $i$ :

$$
\begin{aligned}
& \mathrm{k}=0 ; \operatorname{for}(\mathrm{i}=0 ; \ldots)\{\mathrm{k}+=2 ; \mathrm{b}[\mathrm{k}]=\ldots\} \\
& \operatorname{for}(\mathrm{i}=0 ; \ldots)\left\{\mathrm{b}\left[2^{*} \mathrm{i}+2\right]=\ldots\right\}
\end{aligned}
$$

- Variable $k$ can be substituted in statement $S$ with precondition $P_{S}$ within a loop of index $i$ if $P_{S}$ defines a mapping from $\sigma(i)$ to $\sigma(k)$ :

$$
v \rightarrow\left\{v^{\prime} \mid \exists \sigma \in P_{S} \sigma(i)=v \wedge \sigma(k)=v^{\prime}\right\}
$$

## Constant Propagation

- Replace references by constants:

$$
\begin{aligned}
& \operatorname{if}(j==3) a[2 * j+1]=0 ; \\
& \operatorname{if}(j==3) a[7]=0 ;
\end{aligned}
$$

- An expression e can be substituted under precondition $P$ if:

$$
|\{v \in V a l \mid \exists \sigma \in P v=\mathcal{E}(e, \sigma)\}|=1
$$

- Simplify expressions:

$$
\begin{aligned}
& i f(i+j==n) a[i+j]=0 ; \\
& i f(i+j==n) a[n]=0 ;
\end{aligned}
$$

## Dependence Test for Allen\&Kennedy Parallelization

- If you insist on:
- using an algorithm with restricted applicability
- reducing locality with loop distribution
- Use array regions to deal at least with procedure calls
- Dependence system for two regions of array a in statements $S_{1}$ and $S_{2}$ in a loop nest $\vec{\imath}$ :

$$
\begin{align*}
\left\{\left(\sigma_{1}, \sigma_{2}\right) \mid\right. & \sigma_{1}(\vec{\imath}) \prec \sigma_{2}(\vec{\imath}) \wedge T_{S_{1}, S_{2}}\left(\sigma_{1}, \sigma_{2}\right) \wedge P_{S_{1}}\left(\sigma_{1}\right) \wedge P_{S_{2}}\left(\sigma_{2}\right) \\
& \left.\wedge R_{S_{1}}^{a}\left(\sigma_{1}\right) \cap W_{S_{2}}^{a}\left(\sigma_{2}\right)\right\}=\varnothing \tag{9}
\end{align*}
$$

- Useful for tiling, which includes all unimodular loop transformations

## Dead code elimination

- Remove unused definitions:
int foo(int i) \{int $j=i+1$; $i=2$; int $k=i+1$; return j; \}
$\rightarrow$ int foo(int i) \{int $j=i+1$; return $j ;\}$
- Useless? See some automatically generated code
- Useless? See some manually maintained code -
- Any statement S with no $O U T_{S}$ region?
- Possible, but not efficient with the current semantics of OUT regions in PIPS

## Code synthesis

Time-out!

- Declarations
- Control
- Communications
- Copy operations

## Conclusion: simple polyhedral conditions in a compiler

- Difficulties hidden in a few analyses, available with PIPS: $T, P, W, R$, IN, OUT
- Legality of many program transformations can be checked with analyses: mapping, function, empty set,...
- Yes, quite often:

Control simplification, constant propagation, partial evaluation, induction variable substitution, privatization, scalarization, coarse grain loop parallelization, loop fusion, statement isolation,...

- But not always: graph algorithms are useful too Dead code elimination,... wih OUT regions?

## Conclusion: what might go wrong with polyhedra?

- The analysis you need is not available in PIPS: re-use existing analyses to implement it
- Its accuracy is not sufficient: implement a dynamic analysis (a.k.a. instrumentation)
- The worst case complexity is exponential: exceptions are necessary for recovery
- Monotonicity of results on space, time or magnitude exceptions:
more work needed, exploit parallelism within PIPS
- Possible recomputation of analyses after each transformation: more work needed, composite transformations...

## Conclusion: see what is available in PIPS!

- Many more program transformations
- Pointer analyses are improving
- Try PIPS with no installation cost: http://paws.pips4u.org On-going work... Do not overload our PIPS server ©
- Or install it: http://pips4u.org
- Or install Par4all: http://www.par4all.org
